

Subject: Choosing between React.js and Angular.js for the next Project  
To: Manager

Dear Manager,

I hope this email finds you well. I am writing to you this email to compare 2 popular frontend frameworks React.js and Angular.js and try to make my case in choosing React.js over Angular.js.

Firstly a bit information about these technologies, Angular is a js framework that uses typescript, it has an abundance of libraries itself and provides all the tools to build a web application. It is developed by Google. React is an open source js library used for frontend development. It makes building complex and interactive UIs easier. It is managed by Facebook and the open source community. They are both excellent choices, well supported and rich with features.

The biggest caveat of Angular is its steep learning curve. In comparison React is a lot easier to learn especially for someone that already knows javascript. In addition Angular is less flexible and more complex on project structuring since it enforces the MVC model. React is only the frontend part of the project the View and can be very flexible to fit in different types of models.

The biggest advantages of Angular is it allows cleaner, better structured and more efficient code through the use of Typescript and the OOP principles, a field where React.js can fall behind. Meanwhile it provides a complete solution where React needs the addition of third party libraries.

My personal opinion is that React is the better option for us. It will be an easier transition for the development team. It will be easier and faster to create a prototype. We will be able to be more flexible and not be contained in the Angular ecosystem.

Sincerely,  
Dimitris Sideris
